CARTEK RELEASE NEW PRODUCTS FOR 2017

The ever popular Battery Isolator XS from Cartek is being replaced with the new XR model. This new version features new hardware making it the most powerful electronic Battery Isolator yet. Installation of this new XR version has been made even simpler than the previous XS and also incorporates a 0.5 second delay between transmitting the engine kill signal and disconnecting the battery allowing ECUs time to perform a shutdown sequence before electrical power is lost.

The Wireless Control System has been revised for 2017 where the steering wheel panel is now fitted with plain, unmarked buttons and supplied with two sticker sheets allowing the user to customise their panel. One sticker sheet contains multi coloured symbols while the other is printed using fluorescent yellow ink which glows in the dark under minimal UV light making it suitable for night racing applications.

Cartek will also be displaying their new OBD2 CAN-Bus Signal Converter. This unit will simply plug into the OBD2 port on all modern cars instead of being installed directly into the car's CAN-Bus wiring system. This is therefore a much more convenient, plug-n-play solution for obtaining RPM and Km/h signals for use with shift light and gear indicator product on cars where these signals are not available.
